This paper comprehensively investigates long run monetary neutrality in Japan with due consideration to the order of integration of the money stock and real output, mainly using long term time series data retroactively available from the Meiji era 1868-1912. The empirical results indicate little evidence against the long run neutrality of money, especially defined as  $M2$  with respect to real GNP. In addition, such findings are robust to a wide range of identifying assumptions.

we provide a robustness check of the us phillips curve in the frequency domain we design frequency specific coefficients of correlation  $f_{sc}$  and regression  $f_{scr}$  based on our frequency specific data extraction procedure being real valued signed and normalised the  $f_{sc}$  is superior to traditional indicators such as coherence and cospectrum our  $f_{sc}$  and  $f_{scr}$  estimates suggest that the phillips tradeoffs vary greatly across frequencies with frequent sign reversals they seem to be stable in higher frequencies but unstable in low and medium frequencies and they are sensitive to the level and boundaries of frequency aggregation to the way data are processed prior to analysis eg detrending and to the type of variables used in this sense the phillips curves are fragile the impact of potential cross frequency model inconsistency on model estimation using conventional time domain methods needs careful scrutiny
